### **Accurate Headlamp Alignment from Actia Muller**

With headlamp alignment hot on VOSA's agenda, Actia Muller introduces the innovative 664-4 double laser headlamp beam setter for ultimate precision and reliability. The latest unit to be homologated for MOT testing (Class IV / VII), and also suitable for commercial vehicle pre-testing, Actia Muller's 664-4 double laser aligner is a quality tool which offers faster operation and increased accuracy. Coupled with electronic LUX measurement, alignment of the gauge to the centre of the light unit and parallel to the vehicle is rapid, simple and accurate.

The unit utilises a laser to easily adjust the height of the unit whilst also pin pointing the exact centre of the beam, rather than the traditional and some times vague sight lines and tape measure methods of the past. It also replaces the conventional mirror or box sights, widely recognised as a simple means of squaring the headlamp unit to the vehicle, yet not necessarily accurate. With Actia Muller's Laser Head unit, a second laser beam, split through a prism to give a straight line makes squaring of the unit to the vehicle not only faster than conventional single laser and mirror systems, but also considerably more precise.

This is just one more innovative solution in Actia Muller's "The Complete Workshop" vision of high quality, high tech, affordably priced ATL, garage and diagnostic equipment.
